Abstract

Globalization, collaboration and wireless technologies have led to stiff competition. As a result, commercial banks have
generally adopted the use of e-commerce products and services in their delivery of services to customers. This study’s main objective was to explore the challenges
faced and benefits that accrue from adoption and usage of e-commerce products and services banking by commercial banks in Kenya. A survey was carried out to achieve
the envisaged aims of the study. A total of 100 questionnaires were distributed however only 70 banks responded. Overall, research showed that while the majority of
the banks in Kenya have adopted e-commerce products and services, usage levels have remained relatively low, as not many customers are using this innovation in Kenya.
To establish benefits and challenges in the adoption and usage of e-commerce, 32 variables were used to measure the level of application among these banks. These variables
were analyzed using factor analysis procedure and in order to achieve a simple and meaningful structure, that is, have a nonzero loading of the explained variance for each individual
factors, varimax rotation was done. As a result, 10 critical factors were established as the best practices which include: improved customer service, reduced number of
customers in the banking hall, reduced operating costs and increased market share. The challenges faced in the adoption of e-commerce products and services include
compatibility with existing legacy systems, cost of implementation and security concerns ranked high, ensuring desired levels of security and privacy. Unreliable
telecommunication as well as lack of legislation governing e-commerce transactions rated highly.
Keywords: e-commerce, e-commerce products and services, benefits and challenges, commercial banks
Introduction

Background

E-commerce is a commercial activity dealing directly with the trading of
goods and services and with other related business activities, in which the electronic communication medium plays a central role. These activities include the communication
of information, the management of payment, the negotiating and trading of financial instruments, and the management of transport (Heng, 2003).
E-Commerce is a part of e-business and its goal is to generate profit through the various set of activities based on buying and selling principles. E-commerce is strongly related to the
information technologies and telecommunication technologies. The banking industry as a fast growing industry is facing the challenges of electronic commerce business.
Although the e-commerce basics have been well known for years, some adjustments according to the banking needs have been adopted. An efficient way to do e-business is to
manage Web implementation of the assets that present and support entity’s core business operations, including the software applications and databases
in the information technology environment. Although a significant investment might be expected to cover the requirements of powerful, flexible and secure
technology, there are many tools on the market supporting e-business technology fundamentals and products needed to build e-business solutions (Vedran Batos 2003).
E-commerce has improved business operations, the operations function is that part of the organization that is concerned with the management of the business process that
produces the goods and services supplied to the customer. These processes of order fulfillment and delivery are the heart of every business as they are the means by which an
organization satisfies its customers. An organization can be considered to have e-operations if it uses information technologies (ICT) in the management of its order fulfillment and
delivery processes (Fraser and McDonald 2000).

Three primary processes are enhanced in e-business and they are; the production processes is the
first which include procurement, ordering and replenishment of stocks; processing of payments; electronic links with suppliers; and production control processes, among
others. The second is customer-focused processes, which include promotional and marketing efforts, selling over the Internet, processing of customers’ purchase orders
and payments, and customer support, among others. An internal management process, which is the third, includes employee services, training, internal information-
sharing, video-conferencing, and recruiting. Generally electronic applications enhance information flow between production and sales forces to improve
sales force productivity. Workgroup communications and electronic publishing of internal business information are likewise
made more efficient (Wenninger, 2000).
The Concept of E-Commerce

E-commerce consists of buying and selling of products and services over electronic systems such as
the internet and other computer networks (Mahadavan, 2000). Modern electronic commerce typically uses the World Wide Web at some point in the
transactions lifecycle, although it can encompass a wide range of technologies such as e-mail. A small percentage of e-commerce is conducted entirely electronically for
virtual items such as access to premium content on a website, but most e-commerce eventually involves physical items and their transportation in at least some way.
Today, it encompasses a wide range of business activities and processes, from e-banking to offshore manufacturing to e-logistics. The ever growing dependence of modern
industries on electronically enabled business processes gave impetus to the growth and development of supporting systems, including backend systems, applications and
middleware (Chaudhury et al., 2002). Examples are broad band and fiber optic networks, supply chain management software, customer management software, inventory control
systems and financial accounting software. The emergence of e-commerce also significantly lowered barriers to entry in the selling of many types of
goods; accordingly many home based proprietors are able to use the internet to sell goods. Often small sellers use online auction sites such as e-bay or sell via large corporate
websites such as amazon.com, in order to take advantage of the exposure and set up convenience of such sites (Magutu et al, 2009).
E-Commerce Services and Products

E-commerce products and services are methods used by banking organizations to carry out their transactions.
without necessarily coming into physical contact with their clients. These services include Automatic Teller Machines (ATMs), Electronic Fund Transfer (ETF), mobile banking,
online banking, Electronic Data Interchange (EDI) and telecommunication services.

Credit card is one of the few remarkable innovations
introduced successfully by banks in the last five decades, and it is currently being used extensively in B2C electronic commerce. But it is an expensive means of payment for e-
commerce and many on-line shoppers will prefer other forms of paying for their purchase (Long 2000). So will many on-line retailers who have to cough up set up and transaction
costs and 2-3% of every payment. Moreover credit cards are not suitable for person-to-person trade on the Internet.
In short, e-commerce has created a demand for low cost facility for micro payments and flexible payment (Long 2000). New ways of on-line payments are appearing in the
market, such as deduction from a pre-paid account, electronic billing services, direct transfer out of bank accounts.
There is a possibility for credit card companies and banks to act as information intermediaries. In such a construction, a bank customer downloads software from the bank that
he knows and can trust. With the help of the software, he can browse without the target websites knowing his identity at all. When he decides to buy an article on-line, the software
generates a new identity for him, with a fictitious name and e-mail address, a coded postal address, and a one-off credit card number. The new identity is sent, via the online merchant, back to
the bank. The bank would then check the details of the transaction and approves the transaction. The post office receives a decoded address label and the coded name.
Trading in cyberspace has its risk. This is the sense of uncertainty associated with lack of relevant information that matters (Bodie and Merton 1998). There are interesting emergences in
the new trading environment in cyberspace. For example, there is a demand for rating agencies whose main function is to monitor and grade, on a regular basis, the quality of
goods and services, as well as to rate the ability of buyers and sellers to meet their commitment. The electronic market supports an efficient use of information dispersed
among economic agents. It provides a concrete example of a rational economic order, as described by Hayek (1945). He argues that the economic problem of
society is a problem of the utilization of knowledge not given to anyone in its totality. ‘The peculiar character of the problem of a rational economic order is determined precisely by the
fact that the knowledge of the circumstances of which we must make use never exists in concentrated or integrated form, but solely as the dispersed bits of incomplete and
contradictory knowledge which all the separate individuals possess.

Besides the issues about quality, there is the related concern of fraud which is
often expressed by on-line customers. From the seller’s point of view, there is a new need for him to be guaranteed that the buyers would pay. Banks have entered the picture by
being supportive party in on-line transactions. A buyer of a car (say) offered for sales on-line would get the quality guarantee from a rating agency. After striking the deal with the
seller, he would deposit the money with the bank associated with the electronic market. As a participant against fraud technique, a bank would certify the identities of its
own account holders and act on behalf of its account holders to verify the identities of account holders at other banks. Such intermediary role
increases the security of the on-line business.

E-commerce provides a new avenue for a few of the biggest commercial banks with technological
capabilities to offer other business firms the technology to conduct business-to-business e-commerce (Wenninger 2000). These big players are assuming the role of
automating the entire information flow associated with the procurement and distribution of goods and services among B2B partners’. Being information based and
related to financial transactions, these services are seen by banks as an extension of the cash management services they have been providing to large corporations.
Banks with technological know-how can offer their expertise to assist businesses to participate in e-commerce. In concrete terms, they can help smaller firms set up the
infrastructure and payment capabilities to engage in e-commerce. A few banks are helping small businesses in coping with the negotiation of volume discounts from vendors and electronic
procurement services (Wenninger 2000).
E-Commerce Services and Products: Benefits and Challenges

Some of the benefits that accrue to an organization from implementation of e-
commerce are increased revenue since you will be able to reach more customers, improved customer satisfaction since services will be readily available and fast in their
provision, cost reduction because it will not have to incur heavy wage bill, reduced space requirements and hence reduced rent or lease payments.
Other benefits include increased efficiency since automation enables you to do more with less input, increased level of output and employee satisfaction and motivation since they
will not have to toil really hard. Larger market share through attraction of new customers and customer loyalty may be gained (Czerniawska and Potter, 2000).
In almost all instances, you cannot have any benefit without incurring cost or facing challenges. The following are the challenges that you are likely to face in the implementation of e-
commerce. Your potential customers do not trust your site: The Internet allows mom-and-pop websites to look just as good -maybe even better- than the websites of large
corporations. All potential customers are well aware of this and they will be unimpressed by a sophisticated layout and a professional logo. Potential customers do not trust the
site they have just arrived at, and it must be your conscious decision to do what it takes to make them change their minds (Mahadevan and Venkatesh, 2000).
Security concerns, the site may be attacked by hackers who may use the organization’s website to defraud you existing and other potential customers. Cost of acquisition
installation and maintenance is also another issue that requires the commitment of huge resources to acquire the system, to continuously update it and repair incase
of break down. You also have to invest in employee training or alternatively hire qualified employees who are usually expensive.
Resistances by customers to adopt the new technology since most traditional customers are still shy of technology. They still don’t want to deal with machines when carrying
out their transactions instead they still want to deal with a physically present customer service employee; hence you may find that your system is not
fully utilized (Summer, 1971).

The uptake of e-commerce is influenced by its potential to create business value and by awareness of
its participants of the potential benefits (Magutu et al., 2009) A major reason for most companies, irrespective of size, to participate in business is to extract some benefit from
E-commerce is no different. The benefits of e-commerce identified from the current literature are classified in two main categories - tangible and intangible.
The tangible benefits are benefits that directly accrue to the organization and contribute directly to increase in revenue and profit. These include:
Efficiency which is the ability of the business process to produce the same level of output using reduce resource output or to produce more output using the same level of
input (Fraser et al. 2000; Lee 2001). Increased automation of processes where most of the operational activities which were done by people are carried out by machines
without physical presence of people (Fraser et al. 2000).

E-commerce enables accessibility of markets that would have been otherwise
inaccessible without automation. This is for example customers who wish to carry out transaction at night are taken care of by the use of ATMs. This process leads to
transformation of traditional market chain (Fraser et al. 2000).

Retained and expanded customer base and acquisition of a niche
market. By the use of internet and electronic fund transfer, banks are able to serve customers who are in places where they don’t have branches (Fraser et al. 2000; ahul, Biju and
Reduced operation costs. When people are replaced by machines in an organization, the amount of
salary paid out is reduced and hence the operation cost decrease (Grover and Ramanlal, 2000; Kare-Silver, 1998). Intangible benefits are benefits that do not directly contribute to
increase in revenue but may give goodwill and customer loyalty to the organization. They include, enhancing well-being and education of customers. By providing information to
customers online, they are enabled to learn more about the organization and also how to carry out their transaction effectively and efficiently at reduced time
and cost (Kalakota and Whinston, 1997; Lee 2001).

Improving consumer loyalty, when quality services and products are provided, customers are
likely to make repeatd purchase and relate themselves well with the organization (Lee 2001; Hoffman and Novak, 1999). Give organizations competitive advantage in
that the organization that use automated business processes are able to provide products and services at reduced prices than their competitors. This enables them to beat their
competitors and close out entry of new entries (Kalakota et al. 1999; Hoffman et al. 1999; Straub, 2000; Kare-Silver, 1998).
Offer convenient shopping to customers. Customers are enabled by e-commerce to carry out their transaction at any place in the world and at any time of the day that is
convenient to their unique lifestyle. To extract benefits from e-commerce, it is important for businesses to overcome the e-commerce inhibitors and challenges. E-commerce challenges
identified from the literature are classified as technological, managerial, and business related.

Technological challenges are related to the
acquisition, installation and maintenance of the necessary hardware and software. These challenges are Security and Web site issues (Koved et al. 2001); the organizations data may
face threats from hackers and data loss occasioned by things like viruses. Hackers may also proliferate bank system to transfer money from one account to another and this may make
both the bank customers and the bank itself to lose huge sums of money. This may prove costly to the organization i.e. in their prevention Czerniawska &
Potter, 1998; Alexander, 1998). Technology issues including costs, software and infrastructure; an e-commerce system requires
great expenditure in monetary terms. You need to acquire the hardware, software both initial and maintenance e.t.c. (Hoffman et al. 1999; Abeyesekera et al. 1999; Rahul et al. 2001).
Others are managerial challenges and include people and organizational issues; the people in the organization may resist adoption of the new technology as they may fear
that it would lead to loss of jobs. They may also be reluctant to adopt new methods as they may fear change. Another thing to consider is that, you may need to restructure the
organization and this may be a challenge in itself (Hoffman et al. 1999; Feeny 2000).

Obtaining senior management backing:
every major activity in the organization needs to have management support. A supporting management will provide the necessary resources. If the management does not
support the e-commerce project, it means that the project will lack the necessary resources and is thus bound to fail. (Feeny 2000).
Business challenges include customer service where the bank will lose the personalized service that it offered its customers. When this personal feel is lost, customer loyalty may be
reduced or entirely lost (Whinston et al. 1997; Alter, 1999; Lee 2001). Customers’ old habits; customers may stick with the old habits and may not be ready to adopt
change. They may even lack trust for the new technology and hence your e-commerce system may be under utilized (Schwartz, 1999).
Legal issues may arise from the adoption of e-commerce. The organization may be sued because of a loss suffered from the failure of their system. Again, the
organization may find itself facing new kinds of legislations which are continuously being enacted by the governing bodies, in this case the CBK
Statement of the Problem

The research intended to establish the benefits
enjoyed and the challenges faced by commercial banks in Kenya in their provision of e-commerce products and services.
The early history of banking in the West can be read as a story of the evolution of banks in the process of meeting the needs of modern commerce. Banks in Europe
began as money changers who specialized in accessing and valuing the coins used in claiming some credit for their contribution to e-commerce. Commerce had existed as early as the
division of labor ushered in by the agricultural revolution. But commerce then had not stimulated the emergence of the market centers (De Roover 1948; Lane and Muller 1985;
Summer 1971). In the early 13th century, cities like Venice, Florence and Genoa bloomed and grew to become economic and cultural engines. These cities drove and expressed
new aspirations and ways of thinking directed to material purposes; in the process they created new social behaviors. Venice was a great commercial centre, and it was here that
banking for the first time separated itself from the changing of money (Roberts 1996). They evolved to become deposit banks, acting as custodians of their clients’ money. This
proved to be very useful to traders who gradually learned to trust the banks. With traders coming to accept book entry transfers as payment for their merchandise, banks
acquired the role as payment intermediary between buyers and sellers. As long as the depositors could trust the banks, most of their money was laying idle there. This was soon
discovered by the bankers. They realized that they could hold some reserves against deposits, and could lend out the rest against some collateral or invest in promising business
ventures. “Banks began when men saw from experience that there was not sufficient money in specie for great commerce and great enterprise.” (Summer 197.) With this
new business activity, they carried out an additional role as financial intermediary between savers and investors/borrowers or become investors
themselves. The second role allowed banks to provide liquidity in the economy. This has far-reaching economic consequences, both in the
form of economic benefits and risks.

The intellectual life in Italy at that time was fermenting and vigorous. Florence was the focus of the most
intense and influential cultural activity in the whole of Europe. From 1350 to 1450, more scholars, artists, scientists, architects, and poets lived and worked in Italy than
anywhere else in the western world. Many of them came from other countries to participate and contribute to that great unplanned historical phenomenon known later
as the Renaissance. “Europe went, as it were, to school there.” (Roberts 1996). Against this background of intellectual vitality, flourishing commerce brought with it a chain of
institutional innovations. The bill of exchange appeared in the 13th century along with the first bankers. Limited liability was known in Florence in 1408, and marine insurance
was available before that (Roberts 1996). Double entry bookkeeping evolved to meet the needs of merchants (Bodie and Merton 1998). By 1500, Italians had invented new
credit instruments for banks in the form that we know it. The task was left to modern commerce, i.e. the financing of international commerce. The Amsterdam stock exchange was
established in early 17th century (Braudel 1968).

The 19th century saw the regular market being replaced by continuous trading, purchase by
sample, the rise of shop keeping, and replacement of fairs by produce exchanges or bourses. The contribution of traders to the establishment of banks is well documented
(Summer 1971; Clough and Cole 1968). In Europe, banks were established in centers of great foreign commerce such as Venice, Amsterdam, Hamburg and Nuremberg. It was
“merchant capital which created markets, financed manufactures, floated the American colonial economies and launched banking and insurance.”

(Grassby 1970) Even today,
we still see the role of traders as modest providers of credit to peasants and farmers in developing countries. In emerging economies the activities of traders
promote not only the more efficient deployment of available resources, but also the growth of resources (Bauer 1991).
Although a lot of research work has been done on the prospects and challenges of information technology in firms in Kenya, most of them are broad based and only a few are on e-
commerce services in the banking industry. Muganda (2001) investigated business values of e-commerce amongst selected firms in Kenya. From his study he sought to
investigate the business value of e-commerce amongst firms in Kenya. According to his summary, most of firms on average agree that e-commerce value result in
organizational improvement, transformation and redefinition. Kiyeng’ (2003) reviewed broadly the business effects and challenges faced by
companies which have adopted e-commerce in Kenya. From his study, he was to examine the services offered by e-sokoni to its members and evaluate the impact and challenges faced
by e-sokoni member companies as well as e-sokoni as an e-market. Muyoyo (2004) investigated factors influencing the adoption and implementation of e-
business technologies in companies quoted in NSE and his result showed dominance of basic e-business activities, suggesting considerable scope for future diffusion of
e-business technology in large quoted firms that already use interactive web based information systems. Ojung’a (2005) investigated e-commerce services in commercial Banks in
Kenya. His study gave various outputs and some of them included the extend to bank to bank e-commerce service utilization, extend to bank to customer electronic
payment methods and extend of usage of electronic payment methods. Magutu et al., (2009) modeled the effects of E-Commerce adoption on Business Process
Management: Case Study of Commercial Banks in Kenya.

The aim of the paper was to show that e-commerce has transformed banking.
systems in a radical way. There are three aspects in which e-commerce has affected banking. First, banks use the technology and business practice of ecommerce to market their
services and products to their customers. Second, e-commerce provides business opportunity for banks to offer new products and services to serve the ever changing
needs of e-commerce. Third, the new business environment associated with e-commerce holds potential for institutional innovations in banking, which can help to lay a
sounder foundation for the international financial system.

The specific objectives of the study were: to establish the extent to which E-
commerce services have been utilized in the Kenyan banking sector; to investigate whether E-commerce adoption results in organizational transformation; to identify
the benefits derived by banks from implementation of e-commerce; and lastly, to establish the challenges faced by banks in implementing e-commerce products and services.
Research Strategy

The guiding principles here were the objectives of the study. A survey research design sought information from various banks in
Kenya to examine and analyze the benefits and challenges they face in implementing e-commerce products and services. The population of the study consisted of 44 commercial
banks that are currently operating in Kenya (See appendix II). The target population was at least two members of the management team with representations in the
following dimensions; locally incorporated banks, banks incorporated elsewhere but operating in Kenya, banks in which the government has some share holding and also
based on size. Thus 100 questionnaires were dispatched. Purposeful sampling was employed. The choice of the sampling technique used was due to the fact that the chosen
respondents had the information sought for. This study relied on both primary and secondary data. The questionnaire (See appendix I) was
piloted on 10 banks prior to data collection. This was necessary in order to identify any ambiguous and unclear questions and any questions that were not clear to the respondents
were clarified. The questionnaires were then submitted to the participating firms after the pilot test in order to get the data and information required, which was
administered using e-mail and drop-pick-later method. Follow up was done by telephone. Questionnaires were used because we perceived that it would save on our time.
and it would be flexible with the respondents’ times who mostly have fixed schedules. The questions were structured in such a way that for fixed response questions were rated
against five points scale, from extremely significant (5) to not significant (1). Room was provided for personal responses not captured in the fixed response questions. The
questionnaire was divided into five parts. Part A captured organizational data, part B captured the applications of e-commerce, part C was for reasons for adoption of e-
commerce, part D was for benefits derived from e-commerce and part E captured the challenges faced by the commercial banks in the adoption of e-commerce.
The data from respondents was analyzed using descriptive statistics such as means, percentages and tables. Together with correlation analysis, factor analysis was done to
establish the relationships among the study variables. In particular, factor analysis procedure was used to measure and establish benefits and challenges that commercial banks face in
implementing e-commerce products and services. This method was necessary to reduce a set of several difficult to interpret correlated variables to few conceptually meaningful
relatively independent factors which could be easily interpreted. This technique was applied to summarize 32 latent variables or sub-variables representing dominant
benefits and challenges. To make interpretation easier, a linear transformation on the factor solution, varimax rotation was done, which gave fewer components (factors) that are
uncorrelated with one another. SPSS (Statistical Package for Social Scientists) was used to analyze the data.
Data Analysis and Findings

Data was collected from hundred (100) managers from the commercial banks in Kenya. Of the 100
managers and heads of departments sampled, 70 responded, a reasonably high response rate of 70 percent.
Adoption of E-Commerce

There are a number of e-commerce products and services that banks can offer. They can take various

The respondents were asked to indicate the extent to which they have utilized the bank to bank e-
commerce service. From the 5 point scale used, the table below gives the result.
Table 4.1 B2B E-Commerce Services

Please see Table 4.1 in full PDF version
Since a score of one represents low level of usage of the services while a score of five represented the highest level of usage, to a great extent B2B e-commerce services key to
banks are: EFT electronic payment from bank to bank, EFT via EDI, automated clearing through EFT and the settlement of payment on a gross basis in real time.
Truncation and cheque imaging transmission and Settlement of Government Securities electronically have not gained prominence with banks. This is because of the
developing nature of economy and little investment in e-government.

The respondents were further asked to indicate
the extent to which they have utilized the bank to customer e-commerce service. From the 5-point scale used, the table below gives the result.
Table 4.2 B2C E-Commerce

Please see Table 4.2 in full PDF version
From the results in table 4.2 above, internet banking, EFT, mobile and office banking are the most commonly used B2C e-commerce services by customers with a mean
greater than 4, while Tele-banking and branch banking are moderately used. Home banking is the least popular B2C e-commerce.
Reasons for Adoption of E-Commerce

Banks have various reasons for adoption of e-commerce. The table 4.3 below gives details.
Table 4.3 Reasons for Adoption of E-Commerce

Please see Table 4.3 in full PDF version
The main reason for the adoption of e-commerce by banks was to improve customer service, to cut down on operational costs, to keep up with industry trend and lastly to respond
to customers' demands. Other reasons include expanding bank market share, to increase bank profitability, to create customers awareness of e-commerce services, to
increase geographical reach, profitability and as a response to customers awareness on e-commerce services, to increase customer awareness on bank Products and to
extend bank geographical reach. The most insignificant reason for their adoption was compliance with regulations.
Benefits Derived from E-Commerce

There are various benefits that have been derived by banks in Kenya from the adoption of e-commerce.
The respondents were asked to indicate the extent to which their banks have benefited from the adoption of e-commerce services and products and
the responses are as in table 4.4 below.
Table 4.4 E-Commerce Benefits (Descriptive Statistics)

Please see Table 4.4 in full PDF version
The major benefits derived from e-commerce are:
quickened transaction processing, provided 24/7
availability of your services, increased customer
convenience, increased
customer loyalty, enabled banks to collect customer data, increased bank turnover and profitability, and lastly reduced bank operating overheads. Other benefits include: e-
commerce has provided customers with valuable information about bank business, reduced phone costs and paper work, increased productivity of bank staff and lastly
reduced marketing and advertising costs.

From the scree plot, only 3 factors are significant: quickened transaction processing, provided 24/7
availability of your services, increased customer convenience, and increased customer loyalty.

The latent benefits that have been realized by
banks with the adoption of ecommerce services and products include: expanded customer base, increased customization of products online by bank customers, increased visibility of your
bank through search engine marketing, enabled you to reach a narrow market niche, personalized service, high quality customer service and expanded geographical reach. This is
an indication that the banks have not fully realized the benefits of e-commerce, since some of the key reasons for the adoption of e-commerce have not been realized as benefits.
Table 4.5 Table 4.4 e-Commerce Benefits (Component Matrix)

Please see Table 4.5 Table 4.4 in full PDF version
From the analysis, we were able to extract 3 factors.

- Factor 1 (bank benefits) incorporated all benefits that accrued mainly to the bank.
• Factor 2 (customer benefits) incorporated the benefits that are being derived by the customers from e-commerce.
• Factor 3 (Customer loyalty) symbolized that e-commerce that made customers to be loyal.
Challenges Faced in Adoption E-Commerce

The implementation of e-commerce could not come without challenges. The tables below give an
explanation of the challenges that have been faced.
Table 4.5 Challenges Faced in Adoption E-Commerce (Descriptive Statistics)

Please See Table 4.5 in Full PDF Version
From the research data, the greatest challenge was the use of signatures in electronic documents. Other major challenges of e-commerce in bank operations include: slow
internet speed, security of payments, e-invoicing, privacy of personal data, internet connection failure, data protection and online marketing. Several challenges were ranked
least based on their magnitude:
taxation, data retention,
customer difficulty in using
and finding the websites
and lack of user support.
Table 4.5 Challenges Faced in Adoption E-Commerce (Component Matrix-a)

Please see Table 4.5 (Component Matrix-a) in full PDF Version.
From the analysis and results in table 4.6 the factors that were derived are 3. Factor 1 (data challenge) included data retention, data protection, lack of user support, and
lack of personal contact with customers. Factor 2 (Security) entails security of payments and electronic signatures. Factor 3 (e-services) includes e-invoice and online marketing.
Summary and Conclusions

In line with the general objectives of the study, the following conclusions were arrived at which were
further used to model the operation strategies used in solid waste management.
Conclusions

Based on the results from data analysis, findings and discussions above, one can safely conclude the following:
• First, commercial banks appreciate the e-commerce as evidenced by its wide adoption. Although most commercial banks have introduced e-commerce services and products, it is
not yet very popular with most of their customers. This could be because the majority of the customers who the banks serve, lack enough access to information technology.
infrastructure, knowledge and skills. The banks should popularize the use of e-commerce by educating their customers about their use and the advantages that come with it.
• Secondly, most banks implement the e-commerce facilities for the sole purpose of meeting the organization’s interests like profitability and cost reduction. They should
instead put into consideration other external factors like reducing environmental pollution by not using paper. There are no legal requirements that
commercial banks use e-commerce. The government can introduce such regulation in order to improve the efficiency of the banking industry as well as to reduce the
banking costs incurred by the people.

• Thirdly, although the benefits of implementation of e-commerce are recommendable, the
distribution of such benefits should be put into consideration. This is, for example, people who cannot access internet services can be reached out by improving on easily
accessible and affordable facilities like mobile banking.

• Lastly, although most of the challenges we came across are inherent, most of
them can be reduced. E-commerce in banks is mainly hampered by illegal access and use of restricted information. Commercial banks indicate that internet hackers and computer
viruses are the main threats and also highlight that they spend a significant proportion of funds on these factors.
Limitations and Suggestion for Further Research

There was time and financial constraint in carrying out the research.
The managers were actually too busy and reluctant to participate in the research and had to be really convinced to answer. Some respondents were biased since they feared
disclosing the weaknesses of their banks. This study focused on the e-commerce products and services adopted by commercial banks and the
benefits and challenges they face in adopting these services. Further studies can be focused on the perceptions of customers towards the e-commerce services offered by the
banks. It will also determine the benefits derived and challenges faced by customers who use such services.
Acknowledgement

During the trying moments of conducting this study and its subsequent compilation, which was researched and written.
over a period, many developments took place. Some several key people and institutions therefore need to be acknowledged for their professional generosity and input,
considering the time this research has taken to come to fruition. Firstly, we wish to acknowledge and thank, the four B.Com students, now recognized as co-authors for their effort to
collect data as research assistants by then. Alfred Karwega, whose incisive reading and constructive critiques of the paper in progress have been invaluable. Although not
directly involved, Prof Mbeche, also needs a mention for his generosity to read and comment on various drafts at pivotal times throughout the formation of the Research
paper. We also acknowledge the commercial banks in Kenya (especially, the IT managers) and all those other people who graciously gave their time
to be interviewed/fill the research instrument.
